ABSTRACT OF THE DISCLOSURE

A process for identifying and treating an area of dysfunction. The neurological dysfunction is identified by performing a combined test, such as

5   a combined motor test, a combined sensory test, a muscle lengthening test, a cranial nerve function test, a cognitive test, an autonomic test, or a reflex combined test. Neurological function is restored by resetting nerve supply to the area or physical function being tested by performing corrections for dysfunction until no dysfunction is detected. Preferably a therapeutic device

10 is used to stimulate the area of dysfunction, spine and head until the neurological inhibition is no longer detected.
